3 Introduction

This document provides information on settings within PCS which can only be changed by the RNE Joint Office and the API configuration status in non-production environments.

4 Settings

The following settings are deactivated for every company in PCS as a default. Should a company want to activate or deactivate the setting, they should send a message to support.pcs@rne.eu requesting the change.

4.1 OffsetToReference (OTR)

Information regarding the OffsetToReference functionality is available in the Technical and Functional Specifications (Functional specifications are available upon request to support.pcs@rne.eu). Note that the activation of this setting makes OTR a mandatory field in the GUI and relevant inbound TAF TAP TSI Messages. This functionality can be requested by both applicants and IMs.

4.2 Path Request Split

Information regarding the path request split functionality is available in the Technical and Functional specifications (Functional specifications are available upon request to support.pcs@rne.eu). This functionality will be activated for all requests made in the territory of an IM which requests it.

5 Non-Production Environment API Configurations

The Test and Pre-Production environments are available for all companies wishing to test PCS API functionalities (either via a CI connection or SoapUI). The following sections show the current configuration status of each environment, including whether each company is configured for SoapUI testing (Local RNE CI), or via the common interface (Company CI):

- Outbound communication (messages sent out from PCS): only the messages for which the recipient is a configured company are visible in the outbound message logs in the RNE CI.
- Inbound communication (messages sent to PCS): only the messages for which the sender is a configured company can be processed by RNE CI.

“Local RNE CI”: no connection between RNE’s CI and the company’s CI.

In case a company with a ‘Local RNE CI’ configuration would like to establish a CI connection, or if a company not currently listed in the following sections would like to establish either type of configuration, they can follow the instructions in the [PCS API - First Steps for Connecting](#) document.
